

How to create .gitignore file

I need to add some rules to my `.gitignore` file, however, I can't find it in my project folder. Isn't it created automatically by Xcode? If not, what command allows me to create one?

961

git

xcode4.3

gitignore

If you're using Windows it will not let you create a file without a filename in Windows Explorer. It will give you the error "*You must type a file name*" if you try to rename a text file as `.gitignore`

To get around this I used the following steps

1. Create the text file gitignore.txt
2. Open it in a text editor and add your rules, then save and close
3. Hold SHIFT, right click the folder you're in, then select **Open command window here**
4. Then rename the file in the command line, with `ren gitignore.txt .gitignore`

Alternatively [@HenningCash](#) suggests in the comments

You can get around this Windows Explorer error by appending a dot to the filename without extension: .gitignore. will be automatically changed to .gitignore

As simple as things can (sometimes) be: Just add the following into your preferred command line interface (GNU Bash, Git Bash, etc.)

444

```
touch .gitignore
```

testmenow

~~Update: Tested with Windows CMD and it does not work on Win 8.1+. Nevertheless it does work using Git Bash which you should have installed in Windows if you are using Git.~~

Update: As @Wardy pointed out in the comments, `touch` works on Windows as well as long as you provide the full path. This might also explain why it does not work for some users on *Windows*: The `touch` command seems to not be in the `$PATH` on some Win versions per default.

```
C:\> "c:\program files (x86)\git\bin\touch.exe" .gitignore
```

The .gitignore file is not added to a repository by default. Use vi or your favorite text editor to create the .gitignore file then issue a `git add .gitignore` followed by `git commit -m "message" .gitignore` . The following commands will take care of it.

```
> .gitignore
git add .gitignore
git commit -m "message" .gitignore
```

On Windows you can use `cmd echo "" >.gitignore`

Or use Git Bash `cmd touch .gitignore`, this useful for Linux and Mac System

answered May 17 '16 at 1:05

[seay](#)
449 5 6

`echo > .gitignore` works well. To continue to append the files to ignore, we can do `echo "*.obj" >> .gitignore` – [ozkary](#) Nov 13 '16 at 16:38

I would be careful about using this approach. On my computer, running Windows 10, using `echo` to create `.gitignore` resulted in a UTF 16LE formatted file, which Git apparently did not parse correctly. Creating the file through Windows Explorer resulted in an ANSI formatted file, which worked correctly with Git. – [jlspublic](#) Jun 19 '18 at 2:30

Step 1

While in your project run

```
vim .gitignore
```

A screenshot of a terminal window titled "2. bash". The window has a black background with a blue rectangular selection box highlighting the first three lines of text. The text inside the selection box is: "projects juan.gallardo2\$ mkdir project", "projects juan.gallardo2\$ cd project/", and "project juan.gallardo2\$ vim .gitignore". The cursor is at the end of the third line.

```
2. bash
projects juan.gallardo2$ mkdir project
projects juan.gallardo2$ cd project/
project juan.gallardo2$ vim .gitignore
```

Step 2

You now have your file open with [vim](#).

 Google

Facebook 

Step 3 (option 1)

For Objective-C projects, you can copy from <https://raw.githubusercontent.com/github/gitignore/master/Objective-C.gitignore> and paste it into your .gitignore

A screenshot of a vim editor window titled "2. vim". The editor displays the contents of an Objective-C .gitignore file. The text is as follows:

```
# Xcode
#
build/
*.pbxuser
!default.pbxuser
*.mode1v3
!default.mode1v3
*.mode2v3
!default.mode2v3
*.perspectivev3
!default.perspectivev3
xcuserdata
*.xccheckout
*.moved-aside
DerivedData
*.hmap
*.ipa
*.xcuserstate

# CocoaPods
#
# We recommend against adding the Pods directory to your .gitignore. However
# you should judge for yourself, the pros and cons are mentioned at:
# http://guides.cocoapods.org/using/using-cocoapods.html#should-i-ignore-the-pods-directo
ry-in-source-control
#
# Pods/
~
~
~
~
~
```

Email Sign Up

OR SIGN IN WITH

 Google

Facebook 

Step 3 (option 2)

Add whatever files apply to your project.

If you are not sure what to add, the best keywords to use in your search engine would be to include your project type and text editor. For example, if you use Sublime you would want to add

```
*.sublime-workspace
```

And if you are working with a Cordova project in Dreamweaver you would want to add

```
_notes  
dwsync.xml
```

in windows, open a dos prompt(cmd) windows, use command line:

13

```
type > .gitignore
```

answered Nov 26 '13 at 7:16

caoglish

960 15 27

I have another simple idea

Let's use the echo command in cmd ,

13

```
echo ./idea > .gitignore
```

this will create the .gitignore file having text content "./idea"
you may now manually change data from the file using text editor.

or simply

console :

```
echo .gitignore notepad.exe
```

to instantly edit gitignore.

If you dont know which files are should be gitignored for your IDE or Operating System just goto www.gitignore.io

gitignore.io - here it will generate the gitignore commands or text for you just say your api or os thats it!. Just copy and paste into your file. simple!

<http://gitignore.io> is an open source utility that can help you create useful .gitignore files for your project. There is also a command line API that you can access via a `gi` command: <http://gitignore.io/cli>

1. Install `gi` command for **OSX**:

```
$ echo "function gi() { curl http://gitignore.io/api/\$@ ;}" >> ~/.bash_profile && source ~/.bash_profile
```

2. View .gitignore file contents (Output: <http://gitignore.io/api/xcode,osx>):

```
$ gi xcode,osx
```

3. You should see output on the terminal, if you want to append the results to a new .gitignore file.

```
$ gi xcode,osx >> .gitignore
```

```
C:\Users\y.belyaeva>cd "Documents\Visual Studio 2013\Projects\EntityTrying"
C:\Users\y.belyaeva\Documents\Visual Studio 2013\Projects\EntityTrying>copy con
.gitignore
^Z
```

- **With** start notepad .gitignore **command:**

1. open **cmd** and say `cd` to your git repository
2. say `start notepad .gitignore` and press **Yes** button in opened notepad dialog box.

```
C:\Users\y.belyaeva>start notepad .gitignore
```

- **With** edit .gitignore **command (Windows x86 only):**

1. open **cmd** and say `cd` to your git repository
2. say `edit .gitignore` and close opened edit editor.

1 I had the same weird issue. Turns out to be the encoding, so be sure to save the file as utf-8. – aw04 Sep 16 '15 at 15:44

8

1) create a .gitignore file, so to do that, you just create a .txt file and change the extension as following:

then you have to change the name writing the following line on the cmd:

```
rename git.txt .gitignore
```

where git.txt is the name of the file you've just created.

Then you can open the file and write all the files you don't want to add on the repository. For example mine looks like this:

```
#OS junk files
```

If the repository already exists then you have to do the following:

1) `git rm -r --cached .` 2) `git add .` 3) `git commit -m ".gitignore is now working"`

If the step 2 doesn't work then you should write the whole route of the files that you would like to add.

Hope it helps!

▲ To force Finder to display hidden files and folders via Terminal:

5

Open Terminal

For OS X 10.9 Mavericks, run this command (lower-case finder):

`defaults write com.apple.finder AppleShowAllFiles TRUE`

For OS X 10.8 Mountain Lion, 10.7, or 10.6, run this command (upper-case Finder):

`defaults write com.apple.Finder AppleShowAllFiles true`

notice the setting for true

Then run this command: `killall Finder`

Then exit Terminal

To revert back to Finder's default setting (hide hidden files and folders),
run the opposite command but with the false setting.

Then run `killall Finder` and exit Terminal.
