How can I determine the URL that a local Git repository was originally cloned from?

I pulled a project from GitHub a few days ago. I've since discovered that there are several forks on GitHub, and I neglected to note which one I took originally. How can I determine which of those forks I pulled?

git   github   git-remote

edited Nov 1 '15 at 10:24   asked Nov 3 '10 at 16:47

Peter Mortensen   Tim
14.2k   19   88   114   **17.3k**   3   15   19

116   With git 2.7 (Q4 2015), `git remote get-url origin` will be possible. See <u>my answer below</u> – VonC Oct 7 '15 at 12:08 ✎

13   `git remote get-url origin` does not work for me--possibly deprecated? `git remote show origin` worked though. – Klik Oct 25 '17 at 16:47

---

33   `git remote -v` give you a lot of information, including this. – Thorbjørn Ravn Andersen Dec 10 '17 at 12:21
